Third Session: Urban Computing - Processing spatio-temporal data

<□ > < @ > < E > < E > E のQ @

Agenda for this session

Part 1: Preliminaries

- What is spatio-temporal data?
- How do we represent spatio-temporal data?
- ▶ Part 2: Methods for processing spatio-temporal data

- Spatio-temporal auto-regressive
- Part 3: Methods for processing trajectory data
 - Trajectory pre-processing
 - Trajectory pattern mining (next sessions)

Part 1: Preliminaries

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Examples

Real-world processes being studied in many domains are inherently spatio-temporal in nature including:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Climate science
- Neuroscience
- Social sciences
- Transportation
- Earth sciences

Example

Figure: Example spatio-temporal data, NO2 emissions

Essence of spatio-temporal data

- Temporal and spatial auto-correlation: Nearby values in space and time tend to be alike
- Spatial heterogeneity: as we move away from a central point similarities decrease
- Temporal non-stationarity: as time passes similarities decrease
- Multiple-scale patterns: Daily (temporal scale 1) and seasonal (temporal scale 2) patterns within a patch of land (spatial scale 1) within a landscape (spatial scale 2)

What are spatio-temporal datasets

- Spatio-temporal databases are an extension of spatial databases
- A spatio-temporal database embodies spatial, temporal, and spatio-temporal database concepts:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

- Weather
- Population
- 2. Moving object: an object moving over space \leftarrow
 - People's trajectories
 - Cars' trajectories

Moving objects

- Trajectories: Multi-dimensional sequences containing a temporally ordered list of locations visited by the moving object
- What can we do by analysis of trajectory data?
 - Studying moving objects: Can we cluster a collection of trajectories into a small set of representative groups?
 - Studying locations: Are there frequent sequences of locations within the trajectories that are traversed by multiple moving bodies?

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Data types (processes) and data instances

Figure: Spatio-temporal data instances and data types that can be used to represent them to algorithms as data instances

Part 2: Methods for processing spatio-temporal data

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

...

Many statistical methods designed for spatial data can be extended to the spatio-temporal data:

- Spatio-temporal auto-correlation
- Space-time forecasting (auto-regressive models)
- Spatio-temporal kriging (interpolation)
- Spatio-temporal k-function (e.g. k-nearest neighbors)

Auto-regressive models for spatio-temporal data

 Y_n , Y_t are vectors of dependent variables of size n. ϕ , λ , ρ are model parameters. c is a constant. ϵ represents the noise term. W_n is the spatial weights matrix

Auto-regressive

- $Y_t = c + \sum_{i=1}^{p} \phi_{\tau} Y_{t-\tau} + \epsilon_t$
- Spatial Auto-Regressive model (SAR)

•
$$Y_n = c + \lambda W_n Y_n + \epsilon_n$$

- $W_n Y_n$ is referred to as the spatial lag term in the models
- How we use W_n determines global and local effect

Space-Time Autoregressive model (STAR)

$$Y_{n,t} = c + \sum_{\tau=1}^{p} \phi_{\tau} W_n Y_{n,t-\tau} + \epsilon_{n,t}$$

Exercise: try to derive the equivalent if a spatio-temporal moving average model

Part 3: Methods for processing moving object data (spatio-temporal trajectories)

Trajectory data, moving object data

 Lagrangian motion data: Allows collecting data of the movement of one entity globally

GPS

 Eulerian motion data: Allows collecting data of movement of many entities in restricted spaces

- Wifi scanning
- RFID
- Video surveillance
- Something in the middle:
 - Location-based social networks

What are different ways we can look at trajectory data?

We can query a trajectory dataset in different ways. Thus, we can study the data in different ways.

Query type	Location	Entity	time
1	Fixed	Fixed	Variable
2	Fixed	Variable	Variable
3	Variable	Fixed	Variable
4	Variable	Variable	Variable

Table: Different ways of looking at trajectory data

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Patterns to extract from moving object data

Each type of query allows extracting a different type of pattern:

- Individual
 - Frequent
 - Periodic
 - Outliers
- Social
 - Flock
 - Leadership
 - Convergence
 - Encounter

Spatial

- Spatial interactions
- Spatial functions

Dealing with trajectory data

Trajectory preprocessing (This session)

Pattern mining (Next sessions)

Pre-processing trajectory data

- In which ways can we pre-process trajectory data?
 - \blacktriangleright Reduce the size of data \rightarrow Trajectory compression

 - ► Create workable instances → **Trajectory segmentation**

Trajectory compression

- ► Goal: reducing the dimensionality of the trajectory
- Task: Reducing the size of trajectory while preserving the precision
- Good for:
 - Efficiency (computationally) in pattern mining
 - Efficiency (energy consumption) in data collection procedure: the location of an object can be reported to the server when the precision reduces according to an error threshold.

Essence: finding appropriate techniques and error measures for use in algorithms and performance evaluation.

Techniques for trajectory compression

- Uniform sampling
- Douglas-Peuker \leftarrow
- TD-TR
- Window-based algorithms (sliding window, open window, etc.)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

▶ ...

Douglas-Peuker, Also known as Ramer-Douglas-Peucker

- Widely used in cartography and computer graphics
- Tries to estimate the original trajectory with one that has smaller number of points
- Iterative end-point fit algorithm
 - Recursively divides the line and approximates based on an error threshold
 - The optimization problem is formulated such that it minimizes the area between the original function and the approximate line segments
- Douglas-Peuker does not necessarily find a globally optimal solution

Douglas-Peuker approach

Figure: Step 1

э

Trajectory compression

Error metrics used for implementing trajectory compression:

- Euclidean distance: perpendicular distance between a point and a line
 - Only takes into account the geometric aspect of the trajectory representation without considering the temporal characteristics
- Time synchronized euclidean distance: Is a time-distance ratio metric

•
$$SED(A, B, C) = \sqrt{(x'_B - x_B)^2 + (y'_B - y_B)^2}$$

• where $x'_B = x_A + \frac{x_c - x_A}{t_c - t_A}(t_B - t_A)$ and $y'_B = y_A + \frac{y_c - y_A}{t_c - t_A}(t_B - t_A)$

Trajectory compression: Mode of operation

Batch:

- Leads to high quality approximation due to access to full trajectories
- It is not practical in many applications

Online:

- Typically limits the scope within a window
- Certain trajectory properties can be preserved based on the application's needs
- Intelligently select some negligible location points to retain a satisfactory approximated trajectory

Trajectory compression: Sliding window algorithm

- Main idea: Fitting the location points in a growing sliding window with a valid line segment
- Continues to grow the sliding window until the approximation error exceeds some threshold

Figure: Sliding window algorithm

Trajectory filtering

Trajectory filtering

- Spatial trajectories are often noisy because of the sensing technology
- Filtering techniques are used to smooth the noise and potentially decrease the error in the measurements
- \blacktriangleright This noise is different from the ϵ we had in the autoregressive models

- Trajectory model:
 - $\blacktriangleright \ \mathbf{z}_i = \mathbf{x_i} + \mathbf{v_i} \rightarrow \text{Measurement}$
 - $\mathbf{x}_i = (x_i, y_i) \rightarrow \text{True position}$
 - $\mathbf{v}_i \in N(0, R) \rightarrow \text{Noise}$

Trajectory filtering

Figure: Raw noisy data, Z

Figure: True position Х

Figure: Estimated position $\hat{\mathbf{X}}$

Techniques for trajectory filtering

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- Median filter
- Mean filter
- Kalman filter
- Particle filter
- ▶ ...

Filtering techniques

Mean filter

$$\mathbf{\hat{x}}_i = \frac{1}{n} \sum_{j=i-n+1}^i \mathbf{z}_j$$

Median filter

•
$$\hat{\mathbf{x}}_i = median\{\mathbf{z}_{i-n+1}, \mathbf{z}_{i-n+2}, ..., \mathbf{z}_{i-1}, \mathbf{z}_i\}$$

Mean and Median Filter

Figure: The result of applying the mean and the median filters ¹

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

¹Image source: [ZZ11]

Properties of filters

Mean filter:

- \blacktriangleright Causal \rightarrow depends on the values in the past
- If the trajectory changes suddenly the effect on the trajectory is only gradually seen → It introduces a lag

Sensitive to outliers

Median filter:

Not sensitive to outliers

Median and mean filters

Advantage:

Simple and effective in smoothing trajectories

Disadvantages:

- Both suffer from the lag problem
- They are not designed to help estimate higher order variables like speed and acceleration
- In fact they might reduce the estimation accuracy of higher order variables

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Advanced filters

 Advanced techniques that reduce lag and estimate the trajectory based on more than just location information

- State-space models:
 - Kalman filter
 - Particle filter

State and observations

 States: Things that you cannot measure directly but are interested in estimating

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Examples:
 - The true location
 - The true speed
- **Observations:** Noisy measurements from sensors
- Examples
 - GPS fixes
 - Acceleration

- First use: estimating trajectory of a space craft to the moon and back (There is no GPS trajectory in the space!)
- General idea: estimating the state variables from noisy observations by incorporating the physical domain knowledge
 - \rightarrow Optimal estimation algorithm
 - true location
 - speed
 - acceleration

Applications:

- Error correction
- Data fusion: When measurements are available from various sensors but mixed with noise

- Formulation of Kalman filter makes a distinction between what is measured as observations and what is estimated as states
 - Measurement model: How measurements are related to the states
 - Dynamics model: How previous states are related to future states

Measurement model

$$\mathbf{z}_i = x_i + v_i \longrightarrow \text{Noise vector}$$

 $\mathbf{x}_i = (x_i, y_i)$
 $\mathbf{v}_i \in N(0, R)$

Original trajectory model

$$\mathbf{z}_i = \begin{bmatrix} z_i^{(x)} \\ z_i^{(y)} \end{bmatrix}$$

Noisy measurements of the trajectory data

$$\mathbf{z}_i = H_i \mathbf{x}_i + \mathbf{v}_i$$

Relationship between measurement and state vector

$$\mathbf{x}_{i} = \begin{bmatrix} x_{i} \\ y_{i} \\ s_{i}^{(x)} \\ s_{i}^{(y)} \end{bmatrix} \xrightarrow{} \text{True unknown coordinates}}_{\text{toordinates}}$$

$$\begin{array}{c} \text{True unknown velocity} \\ \text{State vector} \\ \\ H_{i} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{bmatrix}_{\text{Measurement matrix}} \end{array}$$

- Kalman filter gives estimates for the state vector x_i
- H_i is the measurement matrix translating between x_i and z_i and matching the dimensionality of z_i and v_i

Dynamics model

Approximates how the state vector x_i changes with time

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

w_i is the Gaussian noise term

A two-step algorithm that

- Step 1: Using the dynamics model extrapolates the current state to the next state
- Step 2: Incorporates the current measurement to make new estimates (weighted average of predicted state and the measurement)

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ ^へ

2

²image source: [Lab15]

Advantages:

- No lag effect
- Richer state vector (velocity and location)
- It can incorporate more physical knowledge explaining how speed, time and displacement are related to each other
- It can be used to incorporate input from other sensors
- It can be used to incorporate uncertainty (using a covariance matrix)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Limitations:

- To initialize the filter we need to have assumptions about the initial state and the uncertainty of the initial state
- The requirement is having a linear dynamic model
- It uses continuous variables without having a way to represent discrete variables like:

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

- The mode of transportation
- Activity

Particle filter

- Also makes disctinction between measurement and dynamics model
- To formulate these models it does not limit itself to physical movement parameters
- Has less strict assumptions about the linearity of equations and the noise model

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

More general and less efficient

Particle filter

Measurement model:

- ► A conditional Gaussian distribution with covariance matrix R_i
- $\triangleright p(\mathbf{z}_i|\mathbf{x}_i) = N((x_i, y_i), R_i),$

Dynamics model:

- Probability distribution $p(\mathbf{x}_i | \mathbf{x}_{i-1})$
- It samples from the dynamics models
- Instead of formalizing it we generate random samples of x_{i+1} from x_i

- Each generated sample is referred to as a **particle**
- Computation time and accuracy both depend on the number of particles

Particle filter

³image source: [Lab15]

Trajectory segmentation

<□ > < @ > < E > < E > E のQ @

Stops and Moves

- Trajectories are considered as a collection of stops and moves [PBKA08]
- For many applications semantics of points in trajectories are more important than shapes

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Interest regions
 - Stay points
 - Activity regions

Stops and moves

Figure: Stops and moves in a trajectory⁴

・ロト ・ 理 ト ・ ヨ ト ・ ヨ ト ・ ヨ

⁴Image source: [PBKA08]

Not only a spatial clustering task

Challenge:

- We cannot only look at where point are clustered spatially
- We want to find places that one trajectory has stopped but not only the overlap of a lot of trajectories
- We want to find meaningful stops where a lot of trajectories stop and not any random stop

To solve this problem using DBSCAN

- Density-based spatial clustering of applications with noise (DBSCAN)
- Given a set of points in some space, it groups together points that are closely packed together
 - Parameters:
 - Eps (epsilon) (distance threshold between two points to be neighbors)
 - MinPts (the minimum number of points required to form a dense region)
 - Properties of a cluster:
 - ► All points within the cluster are mutually density-connected.
 - If a point is density-reachable from some point of the cluster, it is part of the cluster as well.
- We have to redefine parameters (MinPts, Eps) for clustering regions of interest

Modified DBSCAN for extracting regions of interest

- First identify candidate stops by redefining MinPts
 - A candidate stop is a closed polygon
 - For a candidate stop we also define a minimum stay duration (equivalent of MinPts)

Eps-linear neighborhood of a point

- Let $\{p_0, p_1, \dots, p_n\}$ be points on a trajectory p = (x, y, t)
- Eps(p_k) is a set of points such that:

$$\left(\sum_{i=m}^{k-1} dist(p_i, p_{i+1})\right) \le Eps \cup \left(\sum_{i=k+1}^{n} dist(p_{i-1}, p_i)\right) \le Eps$$

where $t_0 \leq t_m < t_k < t_n \leq t_N$

Lessons learned

Spatio-temporal processes:

- Extension of spatial process (geo-statistic, point, lattice processes)
- Spatio-temporal auto-regressive as a combination of auto-regressive and spatial auto-regressive

Moving objects:

- Technology allows collection of trajectory data of moving object data in different ways:
 - Lagrangian: One individual visiting many locations
 - Eulerian: Many individuals passing one location
- Different patterns can be extracted from data based on how we query the ID of moving objects and locations

Lessons learned (continued)

Trajectory pre-processing:

- Trajectory compression: summarize the trajectory data to key points, save space, save communication, efficient processing
 - Douglas-peuker (batch mode)
 - Window-based (online)
- Trajectory filtering: GPS sensors produce noisy and only approximate location data
 - Mean, Median filters: simple, lag problem
 - State-space filters: defining a measurement (measurement, state relation) and dynamics model (past state, future state relation)
 - Kalman filter (physics laws, inflexible), Particle filter (flexible, slow)
- Trajectory segmentation: Extracting region of interest by extending DBSCAN clustering

End of theory!
